# **MODERN CURRENCY EXCHANGE RATE BEHAVIOUR AND PROPOSED TREND-LIKE FORECASTING MODEL**

Emmanuel TWENEBOAH SENZU  
*Professor of Economics & Investment Banking  
School of Social Science, Njala University of Sierra Leone  
Research Division, Central Bank of Sierra Leone*

A submitted paper to the 5<sup>th</sup> Edition Conference of Econometric Research in Finance by Warsaw School of Economics, Poland. 18<sup>th</sup> September, 2020.

## **ABSTRACT**

The study examined high volatile assets, specifically the currency exchange rate of the open financial market. Takes into consideration the five most traded paired currencies of the global financial market. And observed, generally, the dataset of the unit currency exchange rate exhibit homoscedastic qualities making it appropriate for the use of auto-regression integrated moving average as a reliable model forecast for future pricing of the volatile assets. However, the current model prediction addresses only the magnitude of asset price ignoring its direction, which is the paramount challenge of forecasters. Hence the paper resolves such weakness of the model by introducing a momentum model as a complementary tool to the ARIMA model to determine not only price magnitude but the vector direction of volatile asset pricing relative to the market, dependent on its lagged values.

**Keywords:** Forecast, Momentum-model, Exchange rate, Homoscedacity, ARIMA, GARCH, Hard-currency

## **A. BACKGROUND OF THE TRADE OF CURRENCIES EXCHANGE**

Currency trading and exchange have been a practice since ancient times. With evidence of coinage exchange in ancient Egypt as early as 259 BC, submitted by Von Reden (2017). In the period of 1899 to 1913, the less desire for Gold coinage circulation and its instant availability for trade comparable to paper currency as an alternative option gave birth to the modern style of the forex market. De Roover (1948), argued, during the 15th Century, the Medici family opened Banks in foreign locations to facilitate trade and exchange currencies on behalf of textile merchants. These Banks relied on banknotes and different types of securities without a dominant currency. As Atkin (2005) argued, at the end of 1913 nearly half of the world foreign exchange were conducted in pound sterling and operated by two foreign exchange brokers in London, with the most active trading centers were Paris, New York, and Berlin. By 1928 foreign exchange trading became an integral part of the financial system. At the end of the middle ages, currencies begun being traded through the first network of International Banks. Fast forward to the 17th and 18th Century, Atkin (2005) submit that Amsterdam City was actively managing a forex market with exchange taking place between the agents from England and Holland. In 1944, when the first Bretton woods accord was signed, it allowed different forms of currencies into the basket of exchange and allowed to fluctuate within a range of +/- 1% at par with each other, as put forward by Copeland (2008). But then all currencies existing were pegged to the US-dollar due to its high gold standard status better than any other country after the Second World War. However, modern currency trading started taking it to shape in the 19th Century. It around this time a USA based firm Alexander Brown & Sons became a leading currency trader in the 1950s. Then afterward new businesses began to engage in the business of foreign exchange trading around the 1980s, which is purely believed to have been influenced by the Gold Standard monetary system created in the 1970s with the US dollar. However, the latter unanticipated inefficiencies of the accord of the dollar value struggling to stabilize with time due to the lending and spending of US-government, and the joint float of Europe brought the forex market to a closure for a year from 1972 to March 1973. When the closure was re-opened, it gave birth to another modern form of the forex market, this time involving the State in its management with relatively free market conditions. Geisst (2009) observed, in the 1980s the dollar exchange price began to appreciate against other major currencies due to the vibrancy performance of the US economy, which resulted in a high debt to developing nations and to resolve such deficiency led to the plaza

accord. While the Maastricht treaty of 1992 led to the European Union and Euro- currency to give the European Banks and businesses in the EU zone a distinct edge in the global economy.

Until the mid-1990s the currency trading market was slow. To get an accurate price, it will require you an army of brokers and traders. In the late 1990s brought the internet and advances in communication that changed everything, ushering us into the current sophisticated currency trading market, which allows Bankers to easily create the platforms, which led to a market that trade in high liquidity. And observed to be the largest financial market in the world, followed by the credit market.

Starting from the 1970s, a greater portion of the transactions of the exchange market has migrated to electronic trading platforms. Which include electronic communication networks, trading systems like retail forex platform, single-dealer platform, stock market data system, and others.

However, the fundamental study focus of this paper is the behaviour of the modern currency exchange rate dynamics. Appreciating the fact that in the Securities and Exchange market, has other divisional markets like the stocks, bond, and commodity market, which has attracted sufficient scientific study around their operating performance. However, the researcher contends that the growing sophistication of the exchange market due to the agencies performance experience and investors complex emotional appetite to the trading floors requires modern study into the currency trading market, which is noted to have the highest trading volume yet with a decline in terms of the efficiency of its technical tools for forecasting.

Currencies are traded in pairs in their market and therefore hold no absolute value but rather determines its relative value per the market. In April 2019, the Bank of International Settlements submitted a report of it triennial central bank survey of foreign exchange and the OTC derivatives markets, concluding that \$108 billion comes from currency swaps a day, \$1 trillion in outright forwards, \$2 trillion in spot transactions, \$3.2 trillion in foreign exchange swaps and \$ 294 billion in options and other product. Given a total of \$6.6 trillion currency trading per day.

## **B. LITERATURE REVIEW**

In the forex market, there are two types of currencies for trade. Which the classification is established based on the characteristics of the relative value of the currency at the open market with time. These are hard and soft currency. Chen (2019) defined hard currency as money issued by a nation and seen as politically and economically stable. And outlined major outstanding hard currencies as US-dollar, British Pound, Swiss Franc, Canadian dollar, Australian dollar, and New Zealand dollar. (MBN, 2020) did define soft currency as money with ultra-sensitive to internal and external harmful events and often fluctuates sharply. And sometimes termed as weak currency. It is easier for any trader to forecast the relative price direction and value in a relationship pair between a hard and a soft currency in both short and long term but not that easy to analyze and forecast pairs of the same group of hard currency or soft currency within a certain time range. Venturing into the forex exchange business is a lucrative business to only those who have the competence and the ability to forecast the price direction of the exchange rate of currencies to the future with a high degree of certainty, in other to take advantage of price differencing betting. The desire of modern investors to understand how currencies pairing, behaves on modern sophisticated platforms in terms of the exchange rate of yesterday relating to today is supreme in the forecasting profession. And the mathematical tools required as a method to forecast the price changes accurately into the future became a new theoretical school termed as Technical Analysis. Schulmeister (2005) submitted technical analysis is widely used in the currency market. And argued from his market survey that 90% of market participants in the forex trading industry base their trading forecast in technical analysis. He further stated between 30-40% of trading professionals use technical analysis as their most trading technique. The next critical concern was to examine whether following a set of trading rules, meaning the use of indicators could be profitable to the trader? As a result, different researchers have conducted investigative studies in this area. (Sweeny, 1986: Schulmeister, 1988: Levich & Thomas, 1993: Menkhoff & Schlumberger, 1995: Neely, Weller & Dittmar, 1997: Curcio et.al, 1997: Gencay & Stengos, 1998: Chang & Osler, 1999: Ohlsen, 2004). The findings from all these works of literature came to a single conclusion that to have a technical trading system as a set of rules for the market is profitable but mostly on a sample-based, on daily exchange rates.

Some of the researchers like (Marsh, 2000: LeBaron, 2002: Ohlson, 2004) did further put forward that the profitability of trading rules has declined over time.

(Dempster and Jones, 2002) concluded from their studies that the performance of technical currency trading based on intraday data was very profitable. However, Curcio et.al, 1997 and Neely & Weller, 2003 suggested a contrarily view against Dempster and Jones's studies. Even though some of the studies points in the direction of profitability in reliance on technical analysis is in decline, Schulmeister (2005) posits that the trading professionals' adoption to technical analysis has grown over the years. This puzzle was addressed by (Cheung et.al, 2004: Cheung & Wong, 2000: Gehrig & Menkhoff, 2005) that professional dealers and fund managers do not blindly follow technical models but use the technical models to identify market signals together with other information like news of the market as the fundamental analysis to improve their overall trading performance. Schulmeister (2005) further gave an insight into how traders might use technical analysis less mechanically by sorting out the reason why some of the previous studies concluded technical analysis yielded profitable outcomes yet other studies held a contrary view. He conducted an experiment on the profitability of 1024 moving average and momentum models used for market forecast. Basing the study on the daily exchange rate in the single most active foreign exchange market the DM/\$ market between 1973 and 1999. Then an out-of-Sample test of the performance of all the 1024 models between 2000 and 2004 (Euro/USD) was conducted as a complementary study. These were his findings (Schulmeister, 2005, p.2);

- i. Each of these models [would have been] [*sic*] profitable over the entire sample period. 91.7% of the models [would have] [*sic*] remained profitable out-of-sample tests between 2000 and 2004.
- ii. The number of profitable trades is lower than the number of unprofitable trades.
- iii. The average return per day during profitable positions is smaller than the average loss per day during unprofitable positions.
- iv. Profitable positions last 3 to 5 times longer than unprofitable positions. Hence, the overall profitability of technical currency trading is exclusively due to the exploitation of persistent exchange rate trends
- v. The 25 best performing models in each [of the] in-sample period examined were profitable, [and] also out-of-sample in most cases.

vi. The profitability of technical trading has been significantly lower since the late 1980s as compared to the first 15 years of the floating rate period.

And further observed, the distribution of the exchange rates dataset of the United currency trading, satisfy these properties as a type of statistical distribution

1. The media is negative
2. The Standard deviation is several times higher than the mean
3. The distribution is skewed to the right side and leptokurtic.

And concluded the best performing models produce an annual return of roughly 12% and the worst models roughly 4%.

### **C. THEORY AND EMPIRICAL ANALYSIS**

Since 1985 up to date, there is an estimated amount of 1,500 mainstream models in the technical analytical community for varied assets forecasting, which are collectively termed as indicators. However, the various approach to forecasting price changes of the asset relative to the market highly depends in the use of the Moving Average (MA) models (trend indicators) and Momentum models (oscillating indicators). Yet it is observed, as year's passes by the efficiency and effectiveness of the models as a forecasting tool has declined, which is a suggestive reason for market advancement and the sophistication of investors' actions in the market. As Schulmeister, 2005 posts, there is still a higher desire in the use of the models by professionals in the trading community but does so not mechanically rather on cautionary measures. As a result, the effort of the researcher is to propose a new efficient model as a tool for the forecasting field of study in the currency exchange market precisely, taken cognizant to the complexity of the modern trading market and the sophistication of current price trend dynamics. Addressing the weakness of some of the old models to generate a new theoretical model highly effective in the modern currency market forecast to reduce the burden of model 'mining' among professionals in their choice of searching for their desired model that will meet their 'taste' of risk absorption threshold in the market with a corresponding investment return. In the school of forecasting, both the classical academicians and the competent investment professionals accept that all efficient forecasting models depend on their past dataset analysis to guide future prediction.

However, the difference observed among this two classified group into investment Banking study and practice is, the academic community focus in the study of the past behaviour of underlying assets relative to its market to conduct the forecast analysis, while the Investment professionals in vice versa focus in the general market behaviour relative to the underlying assets to make a probable future prediction of the asset. The different types of approaches produce a slight difference in the outcome result as well as accuracies of the prediction of both short and long term forecast. Which the researcher will consider both experimental conditions to submit a quality model equation for currency exchange rate forecast.

In other to avoid a complex iteration in data analysis and graphical exposition, the study will limit it sample hard currency pairing using the US-dollar either as a base or quoted currency as listed below;

I. USD/JPY II. GBP/USD III. EUR/USD IV. USD/CHF V. USD/AUD

### **C1. Structural homoscedasticity test of dataset**

The researcher began the empirical analysis by conducting a structural homogeneity test for the five labelled variable dataset starting from 1st April 1971 to 31st December 2019, a period of 48 years of exchange rate of daily dataset records to take into consideration if there is data breaks or the entire data set is heteroscedastic to theoretically guide the forecasting model tool development for currencies exchange rate trading dynamics among the hard currency group, outlined as follows JPY/USD; GBP/USD; EUR/USD; AUD/USD; USD/CHF. However, it must be noted some of the Currencies like the CHF and AUD join the foreign exchange market around 1991, with the EUR currency actively participating in the market in 1999, which defines how the researcher collected the data of the aforementioned currency pairing with the USD in respect to their inception date to the targeted date of study as 2019. The researcher is of the view that the quality application of the proposed theoretical model design of this paper as an indicative tool for the currency forecast could effectively apply to the trading relation dynamics among soft-currency groups as well. And believe the proposition could be a guide towards a common currency development program among the countries with fragile economies on the continent of Africa. For instance the case-study of Eco-currency of the ECOWAS zone of Africa.

The following are the experimental outcome of the homogeneity test:

All the five underlying assets of hard-currency pairing were subjected to the following tests as different confirmation approach to time series homogeneity test of variance

The first test was Pettitt's test, is a nonparametric test, which uses the rank-based Mann-Whitney test to identify, where there is a data break-out of homogeneity or there is a shift between two part of the time series as a means to accept or reject the null hypothesis that the data is purely homogeneous.

The Second test of confirmation is Standard Normal Homogeneity Test (SNH), is a test to measure a series of ratios of the observational data and compare to an average in a form of standardization. Therefore if some of the obtained ratios fail to conform to the standardize distribution then the homogeneity test has failed. Which is observed as a good test to detect breaks more easily at the beginning and the end of the data set.

The third test was the Buishand's test (1982), this test examines whether the variables are following one or more distribution that has the same mean. As soon as there is a change of mean then the homogeneity of the test will fail. This type of test is observed to be sensitive to detect breaks of dataset more easily in the middle of the series.

Table.1

### I. Homogeneity Test of USD/JPY Exchange rate data

Summary statistics:							
Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
USD/JPY	12442	0	12442	75.720	358.440	158.607	72.286

Table.2

Pettitt's test (USD/JPY):	
K	37690421.000
t	2/8/1993
p-value (Two-tailed)	< 0.0001
alpha	0.05
The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 51 s.	
99% confidence interval on the p-value: [ 0.000, 0.000 ]	

Fig.3

Table 4.

<i>R</i>	5328.849
<i>p</i> -value (Two-tailed)	< 0.0001
<i>alpha</i>	0.05
The <i>p</i> -value has been computed using 10000 Monte Carlo simulations. Time elapsed: 120s.	
99% confidence interval on the <i>p</i> -value:	
] 0.000,	0.000 [

Table.5

**SUMMARY:**

	Pettitt	SNHT test	Buishand
<b>USD/JPY</b>	<b>&lt;0.0001</b>	<b>&lt;0.0001</b>	<b>&lt;0.0001</b>

The outcome of the various test suggests that the dataset of USD/JPY does not meet pure homogeneity conditions and requires the data to be treated to meet the homoscedasticity requirement for the modelling.

Table.6

## II. Homogeneity Test of GBP/USD Exchange rate data

Summary statistics:							
Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
GBP/USD	12448	0	12448	1.050	2.640	1.719	0.321
Pettitt's test (GBP/USD):							
K	25172614.000						
t	11/12/1982						
p-value (Two-tailed)	< 0.0001						
alpha	0.05						
The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 51 s.							
99% confidence interval on the p-value:							
] 0.000,	0.000 [						

Fig.7

Table.8

	R	3927.371
p-value (Two-tailed)	< 0.0001	
alpha	0.05	
	The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 124s.	
	99% confidence interval on the p-value:	
] 0.000,	0.000 [	
Summary:		
	Pettitt	SNHT test
GBP/USD	<0.0001	<0.0001
	Buishand	<0.0001

The conclusion of the GBP/USD dataset suggests a lack of homogeneous distribution within the dataset, hence dataset required to be treated to meet the requirement of homoscedasticity for the modeling purpose.

Table.9

### III. Homogeneity Test of EUR/USD Exchange rate data

Summary statistics:							
Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
EUR/USD	5455	0	5455	0.827	1.599	1.201	0.164
Pettitt's test (EUR/USD):							
K	4824691.000						
t	12/1/2003						
p-value (Two-tailed)	< 0.0001						
alpha	0.05						
The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 23s.							
99% confidence interval on the p-value:							
] 0.000,	0.000 [						

Fig.10

Table.11

	R	2210.851
p-value (Two-tailed)	< 0.0001	
alpha	0.05	
	The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 53s.	
	99% confidence interval on the p-value:	
	] 0.000, 0.000 [	
Summary:		
	Pettitt	SNHT test
EUR/USD	<0.0001	<0.0001
	Buishand	
	<0.0001	

The conclusion of the EUR/USD dataset suggests of lack of homogeneous distribution within the dataset, hence the dataset required to be treated to meet the requirement of homoscedasticity for the modeling purpose.

Table .12

#### IV. Homogeneity Test of USD/CHF Exchange rate data

Summary statistics:							
Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
USD/CHF	7473	0	7473	0.723	1.820	1.219	0.244
Pettitt's test (USD/CHF):							
K	13674553.000						
t	7/9/2007						
p-value (Two-tailed)	< 0.0001						
alpha	0.05						
The p-value has been computed using 10000 Monte Carlo simulations. Time elapsed: 30s.							
99% confidence interval on the p-value:							
] 0.000, 0.000 [							

Fig.13

Table.14

<b>R</b>		<b>3125.823</b>					
<i>p</i> -value (Two-tailed)	< 0.0001						
<i>alpha</i>	0.05						
The <i>p</i> -value has been computed using 10000 Monte Carlo simulations. Time elapsed: 71 s.							
99% confidence interval on the <i>p</i> -value:							
] 0.000,	0.000 [						
Summary:							
	Pettitt	SNHT test	Buishand				
USD/CHF	<0.0001	<0.0001	<0.0001				

The conclusion of the USD/CHF dataset suggests of lack of homogeneous distribution within the data, hence the dataset required to be treated to meet the requirement of homoscedasticity for the modeling purpose.

Table 15.

## V. Homogeneity Test of AUD/USD Exchange rate data

### Summary statistics:

Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
AUD/USD	7479	0	7479	0.479	1.102	0.760	0.129
Pettitt's test (AUD/USD):							
K	9510085.000						
t	11/2/2004						
<i>p</i> -value (Two-tailed)	< 0.0001						
<i>alpha</i>	0.05						
The <i>p</i> -value has been computed using 10000 Monte Carlo simulations. Time elapsed: 30s.							
99% confidence interval on the <i>p</i> -value:							
] 0.000,	0.000 [						

Fig.16

Table.17

<b>R 2491.018</b>							
<i>p</i> -value (Two-tailed)	< 0.0001						
<i>alpha</i>	0.05						
The <i>p</i> -value has been computed using 10000 Monte Carlo simulations. Time elapsed: 71 s.							
99% confidence interval on the <i>p</i> -value:							
] 0.000,	0.000 [						
<b>Summary:</b>							
	Pettitt	SNHT test	Buishand				
AUD/USD	<0.0001	<0.0001	<0.0001				

The conclusion of the AUD/USD dataset suggests of lack of homogeneous distribution within the data, hence the dataset required to be treated to meet the requirement of homoscedasticity for the modeling purpose.

## C2. Stationarity Test Result

In order to achieve the homogeneity invariance of the dataset and obtain a constant mean, it required a method to iron-out the unit root from the dataset. Hence, the first differential ( $\frac{\delta y}{\delta x}$ ) was applied to obtain stationarity of the dataset. To confirm the stationarity of the dataset, the Dickey-fuller test was run in the method according to Dickey & Fuller (1979). The findings and the graphical display is outlined below.

Table .18

### I. DF-Test for USD/JPY Result

Summary statistics:							
Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
D1.USD/JPY	12442	0	12442	-26.590	18.210	-0.020	1.008
Dickey-Fuller test (ADF(stationary)) / k: 23 / D1.USD/JPY:							
Tau (Observed value)	-20.925						
Tau (Critical value)	-3.378						
p-value (one-tailed)	< 0.0001						
alpha	0.05						

Fig.19

Strong evidence that the USD/JPY dataset has been stationarized when the P-value of the DF-test is less than the critical level alpha (0.05). Including the graph display at the first differential.

Table.20

## II. DF-Test for GBP/USD Result

### Summary statistics:

Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
D1.GBP/USD	12448	0	12448	-0.120	0.070	0.000	0.011
Dickey-Fuller test (ADF(stationary) / k: 23 / D1.GBP/USD):							
Tau (Observed value)	-21.634						
Tau (Critical value)	-3.378						
p-value (one-tailed)	< 0.0001						
alpha	0.05						

Fig.21

Strong evidence that the GBP/USD dataset has been stationarized when the P-value of the DF-test is less than the significant level alpha (0.05). Including the graph display at the first differential.

Table.22

### III. DF-Test for EUR/USD Result

#### Summary statistics:

Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
D1.EUR/USD	5455	0	5455	-0.040	0.049	0.000	0.007
Dickey-Fuller test (ADF(stationary) / k: 17 / D1.EUR/USD):							
Tau (Observed value)	-16.901						
Tau (Critical value)	-3.390						
p-value (one-tailed)	< 0.0001						
alpha	0.05						

Fig.23

Strong evidence that the EUR/USD dataset has been stationarized when the P-value of the DF-test is less than the significant level alpha (0.05). Including the graph display at the first differential.

Table.24

#### IV. DF-Test for USD/CHF Result

##### Summary statistics:

Variable	Observations	Obs. with missing data	Obs. without missing data	Minimum	Maximum	Mean	Std. deviation
D1.USD/CHF	7478	0	7478	-0.161	0.072	0.000	0.009
Dickey-Fuller test (ADF(stationary) / k: 19 / D1.USD/CHF):							
Tau (Observed value)	-18.909						
Tau (Critical value)	-3.407

### **C3. The vulnerability of existing mathematical tool for currency exchange rate forecast**

Over the years, the most prominent statistical tool to forecast time series dataset of the financial market with regression characteristics has been the use of either Auto-regression Integrated Moving Average by Box-Jenkins method (Box & Jenkins, 1970) or Generalized Autoregressive Conditional Heteroskedasticity as a method by Bollerslev (1986) along with varied developed features around these models to address peculiar analytical situations of the forecast. However, in observance to the characteristics of the dataset of the exchange rate of currency trading market, which is the strict study focus of this paper, it was realized, the unit currencies pairs at the exchange market, both hard and soft currencies, their price exhibit the following characteristics as probabilistic distribution at both micro and macrostructure of the market, which are

[i.] Leptokurtic in distribution

[ii.] Positively skewed distribution

[iii.] Hold partial homogeneity, which requires dataset to go through first integration at least.

[iv.] Do not comply with monotonicity function as other assets and portfolios category may uphold such criterion at the exchange market.

These outcomes fulfill theoretical conditions of homoscedasticity, hence makes Box-Jenkins, ARIMA model as currently the best forecasting model equation in currencies exchange rate analysis. Senzu (2020a), concluded from his study that cross-pairing of hard-currency and soft-currency equally uphold homoscedasticity conditions by analyzing the pairing of the US dollar against the leone currency (USD/LL).

ARIMA equation of the five (5) dependent variables under study by this paper as sample representation are outlined below;

$$|\frac{USD}{JPY}|_t = \mu + \beta_p \sum_{i=(t-p)}^{n=p} |\frac{USD}{JPY}| + \varepsilon_t + \phi_q \sum_{i=(t-q)}^{n=q} |\varepsilon| \dots \dots \dots Eq. 1$$

$$|\frac{GBP}{USD}|_t = \mu + \beta_p \sum_{i=(t-p)}^{n=p} |\frac{GBP}{USD}| + \varepsilon_t + \phi_q \sum_{i=(t-q)}^{n=q} |\varepsilon| \dots \dots \dots Eq. 2$$

$$|\frac{EUR}{USD}|_t = \mu + \beta_p \sum_{i=(t-p)}^{n=p} |\frac{EUR}{USD}| + \varepsilon_t + \phi_q \sum_{i=(t-q)}^{n=q} |\varepsilon| \dots \dots \dots Eq. 3$$

$$|\frac{USD}{CHF}|_t = \mu + \beta_p \sum_{i=(t-p)}^{n=p} |\frac{USD}{CHF}| + \varepsilon_t + \phi_q \sum_{i=(t-q)}^{n=q} |\varepsilon| \dots \dots \dots Eq. 4$$

$$|\frac{AUD}{USD}|_t = \mu + \beta_p \sum_{i=(t-p)}^{n=p} |\frac{AUD}{USD}| + \varepsilon_t + \phi_q \sum_{i=(t-q)}^{n=q} |\varepsilon| \dots \dots \dots Eq. 5$$

After conducting the ACF and PACF test to establish the AIC and BIC figures for a suitable model among the series, below are the listed equation model best fit for the forecasting of the dependent variables, with the models verified to have residuals of Gaussian white noise. Below is outlined model equations from Eq.6-10

$$|\frac{USD}{JPY}|_t = \mu + \beta_1 [\frac{\delta y}{\delta x} (\frac{USD}{JPY})]_{t-1} + \beta_2 [\frac{\delta y}{\delta x} (\frac{USD}{JPY})]_{t-2} + \varepsilon_t + \phi_1 \varepsilon_{t-1} \dots \dots \dots Eq. 1 - 6$$

$$|\frac{GBP}{USD}|_t = \mu + \beta_1 [\frac{\delta y}{\delta x} (\frac{USD}{JPY})]_{t-1} + \varepsilon_t + \phi_1 \varepsilon_{t-1} \dots \dots \dots Eq. 2 - 7$$

$$|\frac{EUR}{USD}|_t = \mu + \beta_1[\frac{\delta y}{\delta x}(\frac{EUR}{USD})]_{t-1} + \varepsilon_t + \phi_1\varepsilon_{t-1} + \phi_2\varepsilon_{t-2} \dots \dots \dots Eq.3 - 8$$

$$|\frac{USD}{CHF}|_t = \mu + \beta_1[\frac{\delta y}{\delta x}(\frac{USD}{JPY})]_{t-1} + \varepsilon_t + \phi_1\varepsilon_{t-1} \dots \dots \dots Eq.4 - 9$$

$$|\frac{AUD}{USD}|_t = \mu + \beta_1[\frac{\delta y}{\delta x}(\frac{AUD}{USD})]_{t-1} + \beta_2[\frac{\delta y}{\delta x}(\frac{AUD}{USD})]_{t-2} + \beta_3[\frac{\delta y}{\delta x}(\frac{AUD}{USD})]_{t-3} + \varepsilon_t + \phi_1\varepsilon_{t-1} \\ + \phi_2\varepsilon_{t-2} + \phi_3\varepsilon_{t-3} \dots \dots \dots Eq.5 - 10$$

After the forecasting experiment of the five exchange rate variables under study by the researcher, the following are the observation of the weakness of the ARIMA modeling, after complying with all of the parametric conditions.

[1] ARIMA model becomes a good forecasting tool in the financial market when the asset holds low volatility in its price fluctuation. As the volatility rate level of underlying asset price rises, the ARIMA tool forecasting ability declines in its accuracy to the future price prediction of the asset. As a result, ARIMA as a mathematical forecasting tool for the currency exchange rate with high volatility produces a misleading result.

[2] ARIMA model holds a strong assumption that the level of volatility of underlying asset price of yesterday translates to the state of the volatility of the asset price today and compute the unpredictable effect as white noise, ignoring the vector direction of the state of volatility which has the significant effect in the price direction of the underlying asset at any point in time of forecast. As a result, it predicts price magnitude and ignores the price direction of a volatile asset from its lagging period, which is the paramount interest of a forecaster or a fund manager.

[3] The attempt of the ARIMA model to ignore the relevant forces of the market that define the underlying asset price of the past to the present and hold on to the assumption that such factors are to be considered constant, affect the model accuracy in prediction especially with an extremely volatile market.

The effort of this study was to address such a forecasting error by theoretically proposing a new mathematical model to address such an error effect.

#### **D. THEORITICAL PROPOSED MOMENTUM FORECASTING MODEL FOR HIGH VOLATILE ASSET**

A very critical observation of an open market exchange rate microcosm will deduce to forecasters that, the price evolution of all assets oscillate, and the rate of this oscillation defines the state of underlying asset volatility in relative to the market. The vector direction of this volatility has a significant effect on today's price based on yesterday's asset price by the tool of forecasting. Therefore, if the practice of asset future price prediction is not just an abstract for academic exercise solely but an effort to generate accurate price magnitude and direction as an approximate to the real market pricing for professionals then the current forecasting model, the ARIMA requires a model structural upgrade to the benefit of volatile market forecasters and investment decision-makers.

It is very difficult to predict accurately the random direction of the oscillating prices of a currency, exchange at micro-seconds to establish a mathematical computation for ultimate exchange rate within a particular period, either daily, weekly, monthly, or yearly. Therefore to stationarize the data concludes all external dynamics causal effect on the underlying asset dataset with respect to time are subdue to constant. And if the requirement of the homoscedasticity is met for the dataset time series, then the application of ARIMA model to predict the mean price range defined by the researcher as price magnitude is the best method, however, the model lacks the ability to determine the directional vector of price, which is the most important challenge among forecasters towards decision making and a problem the study sought to resolve for traders and investors in decision making.

In other to translate the directional trend of yesterday's price into today's price of an underlying asset will require the need to understand the 'momentum flow' of the exchange rate of yesterday to today. It is the only mathematical compass to determine the direction of the price of today from yesterday.

Fig.28

Below is Momentum model indicator

In order to compute for the Momentum of the exchange rate of the market, the following symbolic terms to be used are defined below;

$P$  ... .. *Momentum flow of exchange rate of asset relative to the market*

$\psi$  ... .. *Velocity of price of the exchange rate*

$X$  ... .. *Exchange rate of underlying asset*

$V$  ... .. *Volume of traded asset*

$$|\text{Momentum}| = |\text{Volume}| \times |\text{Price Velocity}| \dots \dots \dots \text{i}$$

$$|\text{Price Velocity}| = [\text{Price}_{\text{today}} - \text{Price}_{\text{yesterday}}] \dots \dots \dots \text{ii}$$

$$P = V [\Delta\psi] \dots \dots \dots Eq. 1$$

$$\frac{\Delta\psi}{n} = \frac{\left[\frac{dX}{dt}\right]}{n} \dots \dots \dots Eq. 2$$

Therefore a summation of average price velocity of exchange rate over lagged period of time is equationally, presented below:

$$\sum_{i=(t-p)}^{n=p} |\Delta\psi|/n = \sum_{i=(t-p)}^{n=p} \left[\frac{dX}{dt}\right] \frac{1}{n} \dots \dots \dots Eq. 3$$

Hence, momentum flow over a lagged period of time series is equationally, presented below;

$$P_t = [V] \left[ \sum_{i=(t-p)}^{n=p} \left(\frac{dX}{dt}\right) \frac{1}{n} \right] \dots \dots \dots Eq. 4$$

The result of the equation is a momentum obtained from a lagged period of time series. However, to determine the direction of the price of today from yesterday, you need to understand the highest and lowest momentum of that lagged period to draw inferences. Then the below integral formula is required.

$$\int_{Min(b)}^{Max(a)} P_t d(\psi) = [V][(\psi)]_{Min(b)}^{Max(a)} \dots \dots \dots Eq. 5$$

The rule that guides in selecting ‘a’ and ‘b’ from the lagged values of the asset for the momentum model computation, in respect to equation 5 state;

“The Choice of selecting the ‘N’-lagged time series of the asset in which the value of ‘a’ and ‘b’ of the momentum model will be chosen from for the integral computation of equation 5, should be the same as the ‘N’-time series to predict the future asset price using the ARIMA model.”

These are the various interpretations of the probable results:

1. When the value obtained from Eq.4 is greater than the value obtained from Eq.5, | Eq.4 > Eq.5 | as a lagged values of time series, then the future price prediction of the ARIMA model will take a bearish trend of the market.
2. However, if the value of equation (4) is less than the value obtained from equation (5) | Eq.4 < Eq.5 | of the lagged values of time series, then the future price prediction of the ARIMA model will take a bullish trend of the market.
3. Thirdly, if the value of the equation (4) is equal to the value obtained from equation (5) | Eq.4 = Eq.5 | of the lagged values of time series, then the future price prediction of the ARIMA model will take a lateral view of the market as trend direction.

*It must be noted, the additional pre-requisite conditions for the ‘momentum model’ to hold in its effective functioning depends on the symmetrical information flow of the market in defining the asset and the constant of the volume of the asset from yesterday to today.*

The Volume of asset is easy to be scaled-out from a choice of a market. Which could mathematically be determined as:

$$Volume_{(asset)} = \left[ \frac{\text{Total asset traded within a time period}}{\text{the length of the time period}} \right]$$

## **E. FINDINGS, CONCLUSION AND RECOMMENDATION**

The study takes a critical interest of volatile asset price behaviour of the past and the current under analytical studies. And the outcome findings indicate that, generally, all forms of unit currency exchange rate uphold the homoscedastic character of their dataset. This makes it appropriate for Auto-regression integrated moving average model to be relied on as a predictive model. But the model price predictions fall within the mean range of the lagged price, defined by this paper as a price magnitude ignoring the unsolved questions of professional trading forecasters and investment decision-makers of the accurate price direction of today based on yesterday. Which the ARIMA model lacks the capacity to address such a question hence the researcher developed a complementary model called momentum indicator as a compass of price direction from the past to present a means in deepening the forecasting decision.

The researcher further recommends extensive study in high volatile asset portfolio management. Concluding that a deep understanding of high volatile asset direction at any particular time period guides how to design and compute for a basket of currency selection that will yield a high-profit return curve.
